Optimize Healing with OraSoothe

An alternative to opioid prescriptions, the OraSoothe product line offers a 100% natural way to relieve pain and optimize wound healing

Providing quality dental care and ensuring patient comfort are consistent priorities in every dental practice. But while patients may not experience pain during a procedure, postop pain and discomfort are often inevitable. In recent years, both doctors and patients have given more careful consideration to opioid prescriptions and when they are truly necessary to relieve pain, while at the same time, patients have become wary of artificial ingredients, opting for natural and organic options whenever possible.

At the forefront of pharmaceutical dentistry for over 90 years, Septodont, whose Septocaine and Septoject dental anesthesia solutions are widely used, has begun distributing a 100% natural pain management alternative. The OraSoothe product line includes both the "Sockit" Gel syringe and oral-coating rinses, designed for in-office and at-home preop/postop pain relief, wound care, and healing.

Drug-free and FDA-cleared, OraSoothe products are made from all-natural, Generally Recognized As Safe (GRAS) ingredients, such as mannose polysaccharides from aloe vera, xylitol, and essential oils of cinnamon, clove, and thyme. They can be applied to all irritations and injuries of the oral mucosa and provide pain relief following tissue damage or discomfort.

OraSoothe "Sockit" Gel

Packaged in an easy-to-use syringe, the OraSoothe "Sockit" Gel is ideal for localized applications. Commonly used for dry-socket prevention and extraction site protection, "Sockit" Gel is also ideal for relieving pain and protecting wounds associated with oral surgeries, grafting and implant procedures, hygiene treatments, orthodontic irritations, and

more. Once applied in-office, patients should leave with the remaining gel for easy at-home reapplication, as often as needed, which can help reduce postop visits. Because OraSoothe "Sockit" Gel is drug-free, nontoxic, and

made from GRAS ingredients, it is safe if swallowed and can be used by patients of all ages.

OraSoothe Rinses

Designed for maximum coverage of the oral mucosa, OraSoothe Professional and Hygiene Rinses are used to optimize and enhance wound healing, protect oral wounds, and provide all-natural pain relief before or after invasive dental procedures.

OraSoothe rinses have thicker consistencies that coat the oral mucosa, protecting oral wounds from contamination while providing pain relief at the source. They provide excellent pain relief and protection in larger treatment areas, such as full-mouth extractions, periodontal surgeries, or before and after hygiene procedures like scaling and root planing—without numbing the mouth.

Both rinses offer superior effects when compared with chlorhexidine by guarding the mouth against bacteria associated with periodontal disease. The Professional rinse is intended to be used in-office, while the Hygiene rinse is encouraged to be sent home with the patient for continued wound treatment and pain management.
